Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than other more variable regions.

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81300 to AAA81303 and AAB35620 to AAB3563 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent Neisseria meningitidis DNA sequences, and AAA81322 to AAA81452 represent theis care acid sequences, protein sequences, and antibodies invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the exemplification of the present against them, can be used in the manufacture of a composition on the used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious	v, Galeotti C, Mora M, Ratti G, Scarselli , Pizza M; 318079/27. ucleotide sequences of Neisseria meningitidis e diagnosis and treatment of N. meningitidis i serial infections, for example, N.gonorrhoea age 1482-1483; 1760pp; English.	0. 9; 99W0-US23573. 8; 98US-0103794. 9; 99US-0132068. NIK1 (also referred to as Nek2) is a human homologue of the Aspergillus nidulans mitotic regulator, NIMA kinase. NIK1 is a serine/threonine-specific kinase and is thought to play a k role in cell-cycle events leading to the onset of mitosis. The complexes, their derivatives and NIK1 or NIK1-IP protein and DNA sequences, etc. are useful for treating or preventing a disease or disorder involving aberrant levels of the complex or protein. Such
                                                                                                                                                                                                                                                                                                                                 NIK1 protein as "bait". These are known sequences which encod interacting proteins. The invention concerns purified complex NLK1 protein and a NLK1 protein-interacting protein, where the

The present invention relates to the isolation of human polynucleotide sequences that are differentially expressed during foam cell differentiation. The polynucleotide sequences of the invention or a composition comprising these polynucleotides are useful as a high throughput method for detecting altered expression of one or more polynucleotides in a sample. The polynucleotides are used in the diagnosis of disorders associated with foam cell development such as atheroscierosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polynucleotides gequences can also be used as PCR primers and probes. The polynucleotides of the invention are also useful in gene therapy. Ass94746-As95021 represent the human polynucleotide sequences of the invention which are differentially expressed during form cell differentianty expressed during form cell differentianty.
                                                                                                                                                                                                                                                                                                                                                                    Composition useful for diagnosis of conditions, disorders or diseases associated with atheroscierosis, comprises several polynucleotides that are differentially expressed in foam cell development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens.

            messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting RNAs from a piological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised minitaring the detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised minitaring the detecting RNA transcripts and splice variants of human or animal transcriptomes.
                                                                                                                                                                                                                                                                                                                                                      New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription a genome, useful for detecting tissue-, pathology-, and
                                                                                                                                                                                                                                The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (ABI99202 to ABI9912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. ABI99913 and ABI99914 represent PCR primers for a mouse ischaemic condition related sequence,

```

capable of detecting 1000 or more genes from Drosophila. The inventuesful in developmental biology and in elucidating cell signalling threations in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins

The invention

19

The sequence data specification, but sequences (ABL0184) (ABB57737-ABB72072)

for this patent did not form twas obtained in electronic f

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
